

MATTHEW J.S. SOLANO

ACCOMPLISHMENTS | STAR STORIES | TECHNICAL & BEHAVIORAL PREPARATION

Upland, California | (909) 329-5490 | matthewsolano187@yahoo.com

HOW TO USE THIS LIBRARY

The stories below are truthful frameworks based on verified experience, not invented events. Replace every bracketed coaching prompt with a real example before an interview. Do not add confidential Apple details, customer names, or unverified metrics.

ACCOMPLISHMENT LIBRARY

- Approximately eight years of Apple customer-facing support across in-store and remote channels.
- Hands-on iPhone and iPad repair plus hardware/software diagnostic work.
- Remote phone diagnosis without physically seeing the device.
- Customer relationship recovery and de-escalation during difficult interactions.
- Mentoring and training newer technicians in troubleshooting and communication.
- Published Chase the Cheetah through Amazon KDP; additional books remain in development.
- Active prototype, learning, and production workflows across applications, local AI, generative media, and music.

STAR STORY BANK

Complex remote diagnosis

Situation: A customer called with [real device/service symptom].

Task: Determine the cause without physical access and establish a safe resolution path.

Action: I used [real structured questions], confirmed each observed result, isolated [real variables], and guided the customer through [real steps].

Result: [Add the actual outcome, escalation, feedback, and lesson.]

Customer relationship recovery

Situation: A customer was frustrated because [real non-confidential context].

Task: Lower the temperature, understand the true need, and provide an honest path forward.

Action: I listened without interruption, summarized the concern, clarified constraints, took ownership of next steps, and presented options in plain language.

Result: [Add what changed, how trust was restored, and any verifiable feedback.]

Mentoring a technician

Situation: A newer technician needed help with [real repair, diagnostic, or communication skill].

Task: Help them reason independently rather than simply giving the answer.

Action: I observed their process, explained the reasoning behind each checkpoint, modeled the interaction, and provided focused feedback.

Result: [Add how their confidence or consistency changed.]

Complex ecosystem troubleshooting

Situation: A customer issue involved [real devices, services, accounts, or settings].

Task: Separate interacting causes and reduce confusion.

Action: I mapped the environment, tested one variable at a time, documented findings, and coordinated the appropriate service path.

Result: [Add the actual resolution and lesson.]

AI prototype debugging

Situation: An AI-assisted prototype produced [real layout, input, state, or requirement failure].

Task: Turn an ambiguous failure into a reproducible problem and improve the result.

Action: I documented expected versus actual behavior, narrowed the failure, refined requirements or prompts, tested changes, and compared outcomes.

Result: [Add the actual improvement and current status.]

TECHNICAL TROUBLESHOOTING FRAMEWORK

- Clarify the user impact and desired outcome.
- Reproduce or precisely describe the symptom.

- Separate hardware, software, account, service, network, and user-workflow factors.
- Change one variable at a time and confirm results.
- Explain risk, tradeoffs, and next steps in plain language.
- Document findings and escalate with a concise history when needed.
- Confirm resolution and teach prevention where appropriate.

COMMON INTERVIEW QUESTIONS - ANSWER GUIDES

Tell me about yourself.

Lead with eight years of Apple support, name repair/remote/relationship strengths, then connect them to AI and the target role.

Why are you moving into AI support or customer success?

Explain that emerging AI products need the same disciplined diagnosis, user education, expectation-setting, and feedback translation you practiced in support.

What is your greatest strength?

Choose structured troubleshooting or relationship recovery and attach one real example.

What is a weakness?

Choose a genuine, manageable development area; explain the system you use to improve it. Avoid a disguised strength.

Describe a difficult customer.

Protect confidentiality. Focus on listening, diagnosis, ownership, boundaries, and outcome.

Tell me about an AI project.

State the status first, then cover problem, role, tools, challenge, learning, and next direction. Never imply a prototype is production-ready.

Why should we hire you?

Connect technical judgment, customer empathy, remote communication, and active AI learning directly to the job description.

QUESTIONS TO ASK INTERVIEWERS

- What types of customer or developer problems are hardest for the team today?
- How do support insights influence product, documentation, or engineering priorities?
- What does strong performance look like in the first 90 days?
- How are complex cases documented, escalated, and handed off?
- Which technical skills distinguish top performers on this team?
- How does the team balance speed, accuracy, customer trust, and risk?
- What learning resources or sandbox environments are available for the product?

DETAILS TO CONFIRM BEFORE APPLYING

- Exact Apple and MarketSource employment dates and official job-title chronology.
- Real repair/case volume, customer feedback, recognition, or quality metrics.
- Number of technicians mentored and scope of training responsibility.
- A specific confidential-safe example for each STAR framework.
- Current LinkedIn, GitHub, or portfolio URL, if available.
